

MARKET ASSESSMENT HIGHLIGHTS

Demand, Supply, and Price

- The average weekly demand decreased across all regions.
- The average weekly outage increased in the Luzon and Visayas regions, while it decreased in the Mindanao region.
- Imports from Luzon to Visayas occurred 36.41% of the time, while the flow from Mindanao to Visayas was observed for 96.33% of the time.
- The average weekly GWAP reduced by 15.18%, 46.75% and 56.61% in the Luzon, Visayas, and Mindanao region, respectively.

Energy Offer Pattern Analysis

Luzon

- Biofuel plants recorded dips in nominated capacity on 22 October.
- Coal plants recorded decreases in offered capacity due to outages on 24 October.
- Geothermal plants recorded a decreased in offered and nominated capacity on 22 October.
- Hydro plants showed a decreasing trend in offered capacity starting on 24 October, and no pump operation on 22-24 October.
- Natural gas plants recorded a decreasing trend in offered capacity due to outages.
- Solar plants' lowest nomination was observed on 24 October.
- Wind plants recorded a decrease in nomination on 25 October until the end of the week.

Visayas

- Batteries decreased offered capacities on 26-27 October.
- Biofuel plants decreased nominations on 23 October until the end of the week.
- Coal plants decreased offered capacities on 22 to 25 & 27 of October due to outages.
- Geothermal plants decreased in nominations on 22 October until the end of the week.
- Hydro plants recorded a decreased in nominations on 22-23 October.

Mindanao

- Batteries increased offered capacities on 24 October until the end of the week.
- Biofuel plants recorded dips in nominated capacities on 25 October.
- Geothermal plants recorded decrease in offered capacity on 22-24 October.
- Oil plants had lower offered capacities compared to the previous week.

Market Systems Advisory

- No IT-related issue was advised in the IEMOP's market systems from 21 to 27 October 2024.

Capacity Profile

SUMMARY OF AVERAGE VALUES

Particulars	21 - 27 Oct 2024	14 - 20 Oct 2024	% Change
GWAP (Php/MWh)			
System	3,389	4,859	-30.25%
Luzon	3,516	4,146	-15.18%
Visayas	3,526	6,621	-46.75%
Mindanao	2,797	6,446	-56.61%
EFFECTIVE SUPPLY (MW)			
Luzon	11,020	12,382	-11.00%
Visayas	2,222	2,346	-5.25%
Mindanao	3,166	3,199	-1.04%
DEMAND (MW)			
Luzon	8,985	10,310	-12.84%
Visayas	1,813	2,058	-11.92%
Mindanao	1,958	2,100	-6.73%
OUTAGE (MW)			
Luzon	4,426	3,305	33.95%
Visayas	372	238	56.39%
Mindanao	534	547	-2.22%
RU PRICE (PHP/MWh)			
Luzon	10,984	7,462	47.20%
Visayas	20,779	21,629	-3.93%
Mindanao	7,168	11,649	-38.47%
RD PRICE (PHP/MWh)			
Luzon	9,013	17,289	-47.87%
Visayas	39,147	35,537	10.16%
Mindanao	7,177	8,566	-16.21%
FR PRICE (PHP/MWh)			
Luzon	3,055	3,929	-22.24%
Visayas	9,890	8,349	18.46%
Mindanao	622	5,307	-88.29%
DR PRICE (PHP/MWh)			
Luzon	2,399	2,361	1.59%
Visayas	4,420	2,763	59.97%
Mindanao	3	248	-98.69%

GLOSSARY OF TERMS

CAPACITY ON OUTAGE

Calculated for each 5-min interval as the sum of the capacity of all generating units on outage, which are further distinguished by plant type and category. The generating unit/s on outage and categories of outage are based on the SO's daily operations report. Cited below are the outage categories as defined in ERC Resolution No. 21, Series of 2016.

- Deactivated Shutdown* - refers to a condition where a generating unit is unavailable for service for an extended period of time for reasons not related to equipment and inactive for more than 60 days.
- Forced Maintenance* - An outage that requires immediate removal of a unit from service, another outage state, or a reserve shutdown state.
- Planned* - An outage that does not require immediate removal from the In-Service state but requires a Unit to be removed from the available state before the next planned outage. This is scheduled at least seven (7) days in advance.
- Planned* - The state in which a Unit is unavailable due to inspection, testing, preventive maintenance or overhaul. A Planned Outage is scheduled with a pre-determined duration and is coordinated with the System Operator. The Planned Outage of a Unit shall be reflected in the Grid Operating and Management Program (GOMP).

DEMAND

Calculated for each 5-minute trading interval as the sum of the real time dispatch (RTD) schedule of all load resources plus regional losses.

EFFECTIVE SUPPLY

Calculated for each 5-minute trading interval as the sum of the offered capacity of all scheduled generators considering their offered ramp rates, nominated loading level of nonscheduled generators and projected output of preferential dispatch generators, adjusted for any over-riding constraints imposed by the System Operator (SO), and reserve offers. Output of generators on testing and commissioning were considered based on the over-riding constraints imposed by the SO.

HERFINDAHL-HIRSCHMAN INDEX (HHI)

It is a commonly accepted measure of market concentration that takes into account the relative size and distribution of participants in the market. The HHI is a number between 0 and 10,000, which is calculated as the sum of squares of the participant's market share. The HHI approaches zero when the market has very large number of participants with each having a relatively small market share. In contrary, the HHI increases as the number of participants in the market decreases, and the disparity in the market shares among the participants increases. The following are the widely used HHI screening numbers: (1) less than 1,500 - not concentrated; (2) 1,500 to 2,500 - moderately concentrated; and (3) greater than 2,500 - highly concentrated.

MARKET RESIDUAL SUPPLY INDEX (Market RSI)

The RSI is a dynamic continuous index measured as ratio of the available generation without a generator to the total generation required to supply the demand. The RSI is measured for each generator. The greater the RSI of a generator, the less will be its potential ability to exercise market power and manipulate prices, as there will be sufficient capacity from the other generators. In contrary, the lower the RSI, the greater the market power of a generator (and its potential benefit of exercising market power), as the market is strongly dependent on its availability to be able to fully supply the demand. In particular, a RSI greater than 100% for a generator means that the remaining generators can cover the demand, and in principle that generator cannot manipulate market price. On the other hand, a RSI less than 100% means that the generator is pivotal in supplying the demand.

The RSI for the whole market (Market RSI) is measured as the lowest RSI among all the generators in the market. A Market RSI less than 100% indicates the presence of pivotal generator/s

MARKET SHARE

The fraction of the total capacity or energy that a company or related group owns or controls in the market.

MAJOR PARTICIPANT GROUP

The grouping of generators by ownership or control.

GLOSSARY OF TERMS**NOMINATED CAPACITY**

The available capacity declared by self-scheduled generators.

OFFERED CAPACITY

The available capacity declared by scheduled generators.

PIVOTAL SUPPLIER INDEX (PSI)

The pivotal supplier index is a binary variable (1 for pivotal and 0 for not pivotal) for each generator. The index identifies whether a generator is pivotal in supplying the demand. The PSI is calculated as the percentage of time that a generator is pivotal in a period (i.e. monthly).

POST MARKET RUN CALCULATION

Price adjustment after consideration of different pricing conditions such as AP, SPC, PSM, and PEN.

REGISTERED CAPACITY

The capacity registered by a generator with WESM.

REGISTERED CAPACITY (NET OF OUTAGE)

The capacity registered by a generator with WESM less capacity on outage.

RESERVE CATEGORIES

Regulating (RU and RD) - Readily available and dispatchable generating capacity that is allocated exclusively to correct deviations from the acceptable nominal frequency caused by unpredicted variations in demand or generation output.

Contingency (FR) - Synchronized generation capacity from Qualified Generating Units and Qualified Interruptible Loads allocated to cover the loss or failure of a synchronized generating unit or a transmission element of the power import from a circuit interconnection.

Dispatchable (DR) - Generating Capacity that are readily available for dispatch in order to replenish the Contingency Reserves whenever a generating unit trips or a loss of a single transmission interconnection occurs.
